INTENDED USE: **ENL Gummy** is an orally administered medical food specially formulated to meet the distinctive nutritional requirements of individuals with MTHFR SNP (inborn errors of metabolism), methylation coenzyme/cofactor (Vitamin B12) deficiency, and fatty acid deficiency. It is intended for the clinical dietary management of ADHD under medical supervision.

PRECAUTIONS: Folate doses above 0.1 mg per day may mask vitamin B12 deficiency by improving hematological symptoms, such as those seen in pernicious anemia, without addressing neurological complications. L-methylfolate is believed to have a lower risk of masking B12 deficiency than folic acid. Folate therapy alone is inadequate for the treatment of a vitamin B12 deficiency.

ADVERSE REACTIONS: Allergic reactions have been reported with oral folate supplementation. Mild, transient diarrhea, itching, rash (exanthema), and generalized swelling have been associated with vitamin B12 use.
