### EnLyte PD Gummy Manages the Whole Symptom Complex

The right broad spectrum micronutrient nutritional treatment of ADHD at a young age can be therapeutic and preventative for a lifetime"

Klaus W. Lange  
Institute of Nutritional Psychology  
Frontiers in Psychiatry 2020

# EnLyte PD Gummy

## Use in Children Ages 7-12

**Dosing:** 2 gummies once a day, or EnLyte gel cap once a day for patients who can swallow.

EnLyte PD Gummy & EnLyte gel cap is an evidence-based, all-natural adjunctive or monotherapy strategy for **ADHD and the complete symptom complex**

ADHD is now recognized as a persistent neurodevelopmental disorder with known biochemical, structural, and functional brain anomalies and is 90% genetically related."

**Mahone et al., J IntMD, Neuropsychol Soc.**

The all-natural ingredients in EnLyte adjunctively address the whole disease process effectively and safely."

**Andrew Farah MD, Psychiatrist, Distinguished Fellow APA**

ANDREW FARAH MD, CHIEF OF PSYCHIATRY  
CONE HEALTH RECOMMENDS:

EnLyte Gel Cap Adjunctively  
with Stimulants  
From the Start of Therapy

The all-natural vitamin coenzymes, mineral cofactors, and brain omega-3s in EnLyte address the entire ADHD disease process and the full triad symptom complex safely and effectively at its root cause."

# ADDRESSING THE ADHD SYMPTOM TRIAD

## Focus, Emotional Dysregulation, and Psychiatric Comorbidities Adjunctively Clinical Data - A Case Series

A FARAH MD DFAPA, GAURI MADAN MD, CLINICAL PSYCHIATRY, 2021

### CASE 1

A 7-year-old girl with ADD had benefited from 27 mg of extended-release methylphenidate in terms of focus and grade improvement. However, poor frustration tolerance led to anger outbursts, followed by remorse, periods of dysphoria, and guilty ruminations. Parents believed the stimulant worsened the mood symptoms and requested a decrease to 18 mg a day, which returned the emotional and mood issues to a baseline that was still problematic. Once daily EnLyte resolved these issues with only "minor flare-ups" within six weeks of therapy, and she has remained on the combination for over two years.

### CASE 2

A 7-year-old boy was depressed following his parents' separation. His baseline ADHD, controlled with liquid methylphenidate (25 mg a day), and usual struggles with difficulty modulating anger and emotional control were exacerbated. Fluoxetine 10 mg a day successfully reduced anger outbursts but did not provide overall mood stabilization. MADRS remained unchanged after 4 weeks of therapy. EnLyte was added once daily, leading to symptom improvement, with the MADRS reduced from 14 to 6 at the end of 12 weeks.

\*Full 22 case report available upon request or visit [www.enlyterx.com](http://www.enlyterx.com)

### CASE 3 (New Anecdotal Case Report)

A 6-year-old boy, loved to follow sports and play baseball. Parents reported a noticeable negative change in personality, became disruptive in class with lower grades, and was in the 50th national percentile in standard testing for math. A pediatrician prescribed oral methylphenidate, long-acting liquid with some improvement after two weeks. Two EnLyte PD Gummies were added with immediate noticeable improvement. Over the last three weeks, improvement has continued, along with recently testing in the 80th national percentile on the same test. He received the Citizenship Award at school and there has been noticeable improvement in skills and focus on the baseball team. Parents report that he seems to be his old self again. Pediatrician is reducing stimulant dose and the hope for the parents is maintenance on the all-natural EnLyte PD Gummy.
